

One extra thing, bro

Because the assignment itself has a few places where terminology is inconsistent—for example, it says “**attendance chain**” in the block description even though the project is clearly a **library lending tracker**—I'd tell Claude/Astra to **flag these inconsistencies rather than blindly copying them**. The actual functional requirements clearly describe borrowing/returning library books.

And don't let it just hand you 2,000 lines of C and say “*done.*” 🤦 The strongest workflow is:

Assignment → **requirements checklist** → **architecture** → **concepts** → **implementation** → **tests** → **security audit** → **rubric audit** → **demo** → **report**.

That way, if Claude produces something questionable, you can bring **that specific output back here** and we can inspect it against the actual assignment rather than trusting an AI's “100% complete” claim.
